# ExtendedCalculationHandler

The **handler** is given two **variables**, which it settles with the operator that is given to it. It can also check if these **variables** appear more than once (var1[0], var2[0], var1[1], var2[1],...) and settles these, too.  
The **handler** can be configured check if the **variables** appear multiple times; if so, it can save the sub-totals as **variables** or settle these with a second operator  
If no second operator was transferred, it settles the sub-totals with the first operator.  
The **handler** can be configured to round the results.

---

## Action Class

```
com.dooris.bpm.actionhandler.ExtendedCalculationHandler
```

---

## Event Type

any

## Action Name

any

## Mandatory Fields

none

---

## Parameter

**variable1**

First variable for performing calculations (see [example](#))

## **variable2**

Second variable for performing calculations (see [example](#))

## **index**

If index is passed the value "true", the handler tries to find the two variables with the pattern "var[x]" (beginning with 0) and to settle these with one another. (see [example](#))

## **operator1**

First operator used for performing calculations. Possible options: +, -, \*, /, mod(Modulo), poten. (see [example](#))

## **operator2**

Second operator used for performing calculations. Possible options: +, -, \*, /, mod(Modulo), poten. (see [example](#))

## **result**

Name of the new variable, to which the results will be written. If sub-totals should be saved, these are saved using the pattern result[x]. (see [example](#))

## **multiResult**

If multiResult is given with the value "true", sub-totals will be saved as process variables. (see [example](#))

**round**

Here a number can be given, which tells how many decimal places should be kept when rounding. If nothing is entered, the numbers will not be rounded. (see [example](#))

**Example**

Smartform:

The screenshot shows a software interface titled "Aufgabe" with a green header. Below the header is a navigation bar with tabs: "Eigenschaften", "Dokumente", "Notiz", "Links", "Aufwände", "Graph", and "Smartform". The "Smartform" tab is active. The main area contains several input fields and labels:

- Var1: 2
- Var2: 2
- Var1: 3
- Var2: 3
- Buttons: +, -
- Input field: 13
- Button: Speichern

Mathematical results are displayed to the right of the input fields:

- $2 \times 2 = 4$
- $+$
- $3 \times 3 = 9$
- $= 13$

Parameter:
