TrackTaskProcessor

Description

The Actionhandler creates after the processing of every Task of a Process the following Event.
After a Task is finished, the following variables can be created:

Username of the Editor

First name of the Editor

Surname of the Editor

Email of the Editor

Current Date/Time

With every Loop the Variables can be created with two different Ways:

- With every Repeat a new Variable (optionally activateable): "nodename_taskname_firstname"
The Nodename contains here also the Loop Count [e.g. (L:2)]
- With every Repeat the old Variable will be deleted (it will be always written):
"nodename_taskname_firstname_lastLoop" Only the Nodename (will be deleted with every Repeat)

Action Class

```
com.dooris.bpm.actionhandler.TrackTaskProcessor
```

Event Type

Any

Action Name

Any

Mandatory Fields

none

Parameter

captureLoops

Default → "false"

If "true":

For every Repeat a new variable is created, which contains the Loop Count.

name

Default → "false"

If "true":

Username of the Editor will be stored.

namefirst

Default → "false"

If "true":

First name of the Editor will be stored.

namelast

Default → "false"

If "true":

Surname of the Editor will be stored.

email

Default → "false"

If "true":

Email of the Editor will be stored.

dateAndTime

Default → "false"

If "true":

Current Date and Time will be stored with the following Format: dd.MM.yyyy HH:mm

Caution! The Handler doesn't work retrospective, therefore the best is in the first Node of a

Process, the Event Type “Node-Enter” to use!
