

Jboss encryption module and web frontend for TIM

TIM encoder uses a Jboss module for encryption and to validate keys. The encryption is used e.g. for database connections and third-party applications within the configuration files in order to hide sensitive information like usernames and passwords from plain sight.

To use this module the following steps need to be done:

1. Add the encoder.war of the TIM Encryption Webarchive
2. Modiy the standalone-tim.xml
3. Generating a java key with web-interface or console
4. Use encryption with TIM

Add the encoder.war of the TIM Encryption Webarchive

To enable TIM to encrypt usernames and passwords and to use those encrypted values insert the encoder.war to the standalone\deployments folder in your %JBOSS_HOME% e.g. C:\tim\jboss-eap-7.1\standalone\deployments. Upon JBoss startup it will deploy automatically.

Modify the standalone-tim.xml

```

<subsystem xmlns="urn:jboss:domain:datasources:1.2">
    <datasources>
        <datasource jta="true" jndi-name="java:/doorisPortalDB" pool-name="doorisPortalDB" enabled="true" use-java-context="true" use-ccm="true">
            <connection-url>jdbc:sqlserver://localhost:1433;databaseName=test;</connection-url>
            <driver>sqlserver</driver>
            <pool>
                <min-pool-size>20</min-pool-size>
                <max-pool-size>150</max-pool-size>
            </pool>
            <!--security>
                <user-name>test</user-name>
                <password>test</password>
            </security-->
            <security>
                <security-domain>secDomDS</security-domain>
            </security>
            <validation>
                <check-valid-connection-sql>SELECT 1</check-valid-connection-sql>
                <validate-on-match>true</validate-on-match>
                <background-validation>false</background-validation>
                <use-fast-fail>false</use-fast-fail>
            </validation>
        </datasource>
    </datasources>

```

e

standalone.xml are made accordingly. In your subsystem datasource below your database implemet:

```

<security>
    <security-domain>secDomDS</security-domain>

```

```
</security>
```

as can be seen in the first screenshot.

In the *subsystem security* add:

```
<security-domain name="secDomDS" cache-type="default">
    <authentication>
        <login-module
code="org.picketbox.datasource.security.TimSecureIdentityLoginModule"
flag="required">
            <module-option name="username" value="$enc$c5507593f47122e"/>
            <module-option name="password"
value="$enc$-3c3702fd5f714bd0045dcdd12584c8"/>
        </login-module>
    </authentication>
</security-domain>
```

as can be seen in the screenshot below.

```
<subsystem xmlns="urn:jboss:domain:security:1.2">
    <security-domains>
        <security-domain name="other" cache-type="default">
            <authentication>
                <login-module code="Remoting" flag="optional">
                    <module-option name="password-stacking" value="useFirstPass"/>
                </login-module>
                <login-module code="RealmDirect" flag="required">
                    <module-option name="password-stacking" value="useFirstPass"/>
                </login-module>
            </authentication>
        </security-domain>
        <security-domain name="jboss-web-policy" cache-type="default">
            <authorization>
                <policy-module code="Delegating" flag="required"/>
            </authorization>
        </security-domain>
        <security-domain name="jboss-ejb-policy" cache-type="default">
            <authorization>
                <policy-module code="Delegating" flag="required"/>
            </authorization>
        </security-domain>
        <security-domain name="loom" cache-type="default">
            <authentication>
                <login-module code="com.dooris.security.LoomLoginModule" flag="required"/>
            </authentication>
        </security-domain>
        <security-domain name="secDomDS" cache-type="default">
            <authentication>
                <login-module code="org.picketbox.datasource.security.TimSecureIdentityLoginModule" flag="required">
                    <module-option name="username" value="$enc$3b7965db3d853e17"/>
                    <module-option name="password" value="$enc$-44f6b421a454e75a"/>
                </login-module>
            </authentication>
        </security-domain>
    </security-domains>
</subsystem>
```

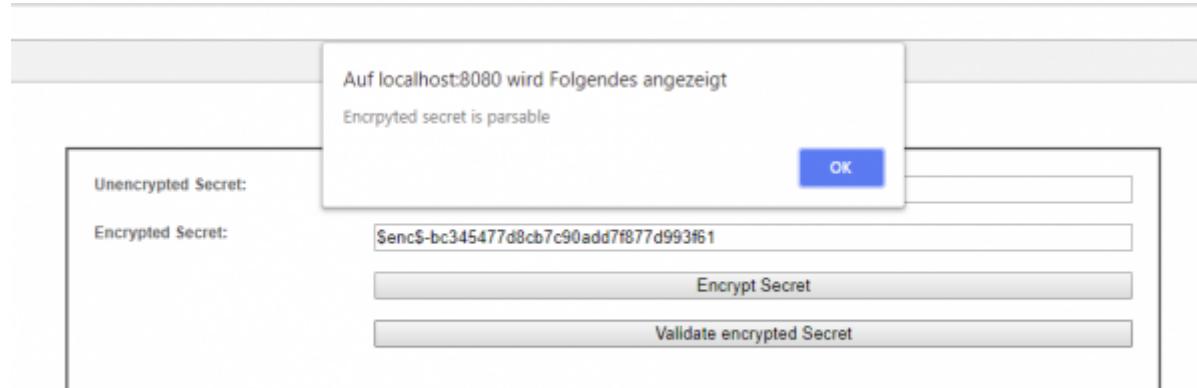

Generating a java key with web-interface or console

There are two ways to encrypt your credentials. Either with the web-interface or with via the console.

The module can be called via the web-interface e.g. http://your_tim_url:port/encoder/. In oder to

encrypt a secret insert use the text field and hit the *encrypt secret* button. To validate a encrypted secret past the secret in the correct text field and hit the *validate encrypted secret* button. This method can as well be used to encrypt any secret in e.g tim.properties or dashboard.properties.

The screenshot shows a web form with two text input fields. The first field is labeled "Unencrypted Secret:" and contains a masked password. The second field is labeled "Encrypted Secret:" and contains the encrypted string "\$enc\$-bc345477d8cb7c90add7f877d993f61". Below these fields are two buttons: "Encrypt Secret" (highlighted in blue) and "Validate encrypted Secret".

To encode your credentials via console use the following commands:

to generate a key:

```
java -cp modules/system/layers/base/org/picketbox/main/tim-encoder-
module.jar:modules/system/layers/base/org/picketbox/main/picketbox-4.1.1.Fin-
al-redhat-1.jar
org.picketbox.datasource.security.TimSecureIdentityLoginModule '123'
```

to validate password-key combination:

```
java -cp modules/system/layers/base/org/picketbox/main/tim-encoder-
module.jar:modules/system/layers/base/org/picketbox/main/picketbox-4.1.1.Fin-
al-redhat-1.jar
org.picketbox.datasource.security.TimSecureIdentityLoginModule '123'
'$enc$b530c41fe274111'
```

to validate the key:

```
java -cp modules/system/layers/base/org/picketbox/main/tim-encoder-
module.jar:modules/system/layers/base/org/picketbox/main/picketbox-4.1.1.Fin-
al-redhat-1.jar
org.picketbox.datasource.security.TimSecureIdentityLoginModule ''
```

```
'$enc$b530c41fe274111'
```

TIM Properties

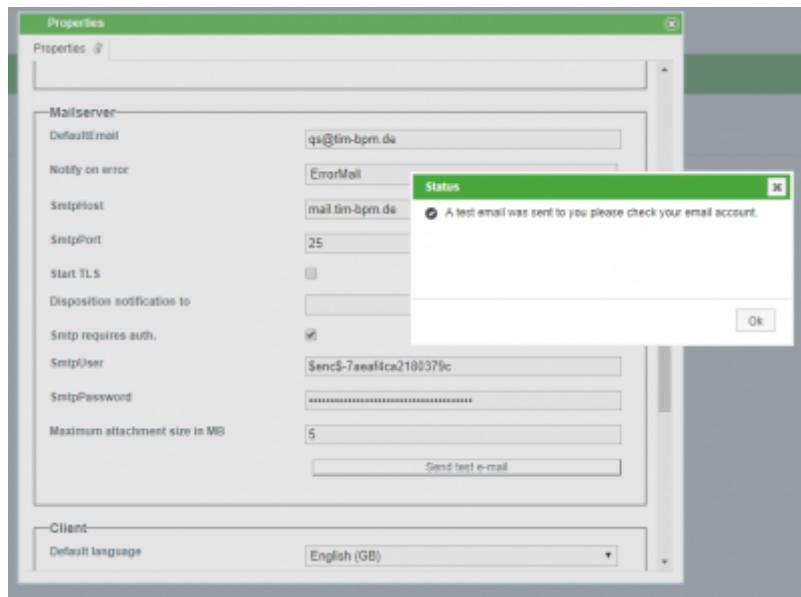

In tim.properties credentials can be encrypted with the encoder or the console and replace plain text usernames and passwords. As an example the image shows setting and editing the superuser and client-administrator passwords:

```
#Default init password
initpass-super-admin=$enc$7875f8726e1ed2c7
initpass-super-sys.support=$enc$-66c2ca6af02ba4c5
initpass-x-admin=$enc$66cb4a689ca87a97
initpass-x-sys.support=$enc$-37fa8d4f2b81e0c9
initpass-x-others=$enc$6ec2f555069f3cal
```

E-Mail Configuration

In the properties of the client under the category mail server are the parameters SmtUser and SmtPassword.

These credentials can be encrypted accordingly to the methods above and as shown in the example.

Actionhandler

Actionhandler like `HTTPRequestHandler` or `RunSqlScriptHandler` use credentials that can be encrypted by said methods. The example shows the `RunSqlScriptHandler` where `${user}` and `${pass}` are

Name: dbCall

Event Type: Node Leave

Event Class: com.dooris.bpm.actionhandler.RunSqlScriptHandler

Mandatory Fields:

Parameter:

- databaseEngine: \${databaseEngine}; Edit
- connectionString: \${connectionString}; Edit
- host: \${host}; Edit
- port: \${port}; Edit

```

graph LR
    SQL[SQL] --> CallREST[Call REST]
    CallREST --> REST{REST call successful?}
    REST -- No --> LogError[Log Error]
    REST -- Yes --> CallDB[Call DB]
    CallDB --> DB{DB call successful?}
    DB -- No --> LogError
    DB -- Yes --> End(( ))
    
```

RunSqlScriptHandler	databaseEngine	mysql
connectionString	jdbc:mysql://localhost:1433/databaseName=tim_594;	
host	localhost	
port	1433	
database	tim_594	
User	benc3b7965db3d852e17	
pass	\$enc5-42792b0e12a4cd95	
query	SELECT * FROM Mitarbeiter WHERE Gehalt>50000;	

Timer

Just like actionhandler TIM can encrypt necessary credentials for timers and hide them from plain text. The example shows the Timer signalByMailReply:

Administration									
Administration	User	Context-roles	Scheduled jobs	Mail queue	Costcenters				
Timer name	Weservice name	Weservice methode	Parameter			Interval	Max. recursion	Act. recursion	Status
signalProcessInstanceByNameAndTime	ProcessInstanceManager	signalProcessInstanceByNameAndTime	%signalProcessInstanceByName%,Activity,1s,100 @Create timed call			1s	1	0	- 25/06/2018, 04:49
SignalByMailReply	ProcessInstanceManager	signalByMailReply	on@tim-bpm.de,\$enc5-309923900ec9662fbc39275f6695b4a84,143.192.168.1.10,TNR-4273 SignalByMailReply,-,"(Wait4)-",false,helper.nein.nein,ja,ja,(Wait4?)Antwort,"\$"			10m	1	0	- 09/04/2018, 09:48
