

Introduction

TIM is a Java-based application which runs (at the moment exclusively) in JBoss and which requires a database as storage medium.

On request you will receive the installation package at TIM (support@tim-solutions.de)

This documentation will only focus on an installation in Windows. This documentation might otherwise also be used for a Linux-based operating system if there is enough necessary expertise to make the adaptation.

Hardware requirements

You will find the the most up-to-date [requirements](#) on this page.

Content of the installation package

The installation package is distributed in ZIP-format and therefore has to be unzipped. The folders and files depicted on this picture are momentarily combined in one single ZIP-file.

FirefoxPortable

This is a portable Firefox browser which is supposed to be used to check for issues of compatibility and to test functions of Javascript in a more efficient way.

JBoss

This is the specific JBoss which has been set up to run TIM. Alternatively, if available, an already existing server may be used for this purpose.

MySQL

This is a freely available data base system. Please refer to this [page](#) to get more detailed information on which exact version is being supported at the moment.

OOP

An Openoffice Headless Server (without the user interface!) which is necessary to convert Word-files into PDFs.

Java-JDK

The most up-to-date available Java version which is required to run the Java-based JBoss server.

NPP (Notepad++)

This is a very comprehensive text editor which adds a necessary entry to the [context menu](#) of MS Windows.

An overview of the first steps

1. [Installation of Java JDK](#)
2. [Installation and configuration MySQL as a data base](#)
3. [Installation and configuration of JBoss](#)
4. [Installation and configuration of TIM](#)

This presupposes a running MySQL server.

5. [Installation of TIM - Document Converter](#)

This is required to convert Word templates into PDFs. Please refer to this [page](#) for further information on how to use the TIM - Document Converter.

6. [Installation of the Dashboard](#)

The Dashboard can be used by a process manager to conduct analyses of crucial data.
