

## Process Definition

A process definition contains the process model including the fundamental workflow logic for the entire process run. Process definitions are the first tier within the ordering of all elements. The process definition defines the general procedures of a process. No values are provided at this stage. A process definition is composed of several activities, which are supposed to be done within a certain order. Each activity itself is comprised at least one single task that has to be done by an employee.

**Instances** are started based on a process definition and then follow the process model of the particular definition.
