Pick out TIM groups and presenting in selectbox

To create a selectbox with **all** groups in the TIM client, we need the following code:

```
<select name="REPLACE_ME" id="REPLACE_ME"
initMethod="getAllGroups"></select>
```

To exclude individual groups in the selectbox, we need the following code:

```
<select name="REPLACE_ME" id="REPLACE_ME" initMethod="getAllGroups"
class="(exclude),Gruppe_eins,Gruppe_zwei,Gruppe_drei"></select>
```

The groups which should be excluded are to be given in the class name seperated with commas. **In front of the groups we need the keyword (exclude)!**

To present single groups, we need the following code:

```
<select name="REPLACE_ME" id="REPLACE_ME" initMethod="getAllGroups"
class="(include),Gruppe_eins,Gruppe_zwei,Gruppe_drei"></select>
```

The groups which should be excluded are to be given in the class name seperated with commas. **In front of the groups we need the keyword (include)!**

After selecting one group various process variables are created in the background:

- REPLACE_ME= Selection the Selectbox
- REPLACE_MEExpression= group(Selection of Selectbox)
- REPLACE_MEID= ID of the group
