Swimlanes

One company can be subdivided into several smaller subdivisions. These divisions can be represented in the process modeling through so-called "Swimlanes". A Swimlane can be assigned to a specific user or a group for further processing.
All activities and tasks within a Swimlane can be assigned via predefined assignments.
Sometime Tasks must be assigned directly to one person and not to a group. Therefore Version v4.3 has the possibility to assign a task directly by calling this syntax

group(<GRUPPENNAME>)–>member(<MEMBERSHIPNAME>)

Beispiel

In this example we will search for a membership called **"Freising"**. Its also possible to use Processvariables to hand over Membership-Names.

group(work council)–>member(${city})
