FAQ iGrafx

F : What is the reason that a process containing sub-processes can't be deployed?

F: Error message: "max one start-state allowed in a process"

A: Within iGrafx a file can contain several processes. However, only one file can be deployed in TIM at a time. If there are several processes available, iGrafx would not be able to decide which distinct process to deploy. This will then trigger the message that only one start-event is allowed. This is the solution to the problem: There should only be one process assigned to a file while copying and pasting processes in different files is still possible (by right-clicking on the file system tree!).

F: Why aren't there any properties of TIM assigned to an element?

A: Please install the TIM Plugin to use the iGrafix Flowcharter. Please refer to this [instruction](#) on how to benefit by properly installing iGrafix on your computer.
