

Deploying a Process Definition

In order for a process definition to be successfully integrated into TIM and be ready to use, it first has to be deployed/uploaded. The Deploy-interface is used to issue a process definition in TIM. The interface can be called under:

```
http://<server>:<port>/loom-portal/deploy.htm
```

The Process definition itself must have either the appropriate [user](#) or one of its [groups](#) listed as the [deployer](#). Additionally, this user or group must have the role of [deployer](#) in TIM. Lastly, the process definition has to be passed to TIM as either a .zip file or as a bpmn file.

Also, the process definition has to be exported as a .zip file and released in TIM.

An SVG Graphic for a bpmn is optional. A zip-file already contains a graphic and therefore a graphic does not need to be added

The screenshot shows the 'Deployment' interface of TIM. It includes fields for 'Processdefinition (zip/bpmn):' with a file selection button and the text 'Aenderung...lner.zip', 'Processimage (svg):' with a file selection button and the text 'Keine ausgewählt', 'User:' with the text 'wiki/deploy.user', 'Password:' with a masked input field, and 'Comment:' with an empty text box. There is a checked checkbox for 'Publish process automatically:' and a 'Deploy Process' button at the bottom. The TIM logo is in the top right corner.

TIM - Task In Motion

The screenshot shows the 'Deployment' interface of TIM with different file selections. The 'Processdefinition (zip/bpmn):' field now shows 'processd...bpmn.xml' and the 'Processimage (svg):' field shows 'processimage.svg'. All other fields, including the user 'wiki/deploy.user', the masked password, the empty comment box, the checked 'Publish process automatically:' checkbox, and the 'Deploy Process' button, remain the same. The TIM logo is in the top right corner.

TIM - Task In Motion

A confirmation message will be shown after the deployment procedure has been executed successfully (without any problems).

Processdefinition Kundenumfrage was deployed successfully! (04.01 9:38:40)

Automatically Deploying the Process

Should the process still require configuring within the [ProcessRepository](#) before being deployed, then the check-box marked **Publish process automatically** can be deactivated.

If the option is deactivated, it will appear only in the final deployment.

Direct deployment from the model

If the process is to be deployed without being exported beforehand, this can be accomplished using the following URLs

```
http://<server>:<port>/loom-portal/Deploy.iGrafX
```

or

```
http://<server>:<port>/loom-portal/Deploy.signavio
```

If the process should not be directly activated here, this may be designated by adding the suffix ? **publish=false**.

```
http://<server>:<port>/loom-portal/Deploy.iGrafX?publish=false
```

Error and Error Removal

If an error occurs and the process definition is not deployed thereafter, the following points should be addressed before contacting support for help: * Is the user correctly entered or is the [Mandant](#) missing? * Is the password entered correctly or is the [LDAP Authentication](#) on/off? * Is the correct user/group used entered as the deployer? * Does the user have **deployer rights**? * Are all of the groups correctly entered into the characteristics of the process model?

A message will also be shown if an error occurs.

If problems are still experienced, please contact TIM via e-mail at support@tim-solutions.de. Please send the file **server.log** as an attachment.
